12.13.6.15 : Question. An electronic assembley consists of two subsystems,say A and B.From previous testing procedures, the following probabilities are assumed to be known:

$$\Pr(A\ fails) = 0.20$$

$$\Pr(B\ alone\ fails) = 0.15$$

$$\Pr(A\ and\ B\ fails) = 0.15$$

Evaluate the following probabilities

$$(i)\ \Pr(A\ fails\ given\ B\ has\ failed)$$

$$(ii)\ \Pr(A\ fails\ alone)$$

ans:

$$\Pr(A\ fails\ given\ B\ has\ failed) = 0.50$$

$$\Pr(A\ fails\ alone) = 0.05$$

Solution: Given ,

$$\Pr(A') = 0.20 \quad \Pr(AB') = 0.15 \quad \Pr(A'B') = 0.15 \tag{1}$$

Now to find,$\Pr(A'|B')$ we use

$$\Pr(A'|B') = \frac{\Pr(A'B')}{\Pr(B')} \tag{2}$$

to obtain $\Pr(B')$ we use,

$$\Pr(B') = \Pr(AB') + \Pr(A'B') \tag{3}$$

$$= 0.15 + 0.15 \tag{4}$$

$$\Pr(B') = 0.30 \tag{5}$$

now to find $\Pr(A'|B')$

$$\Pr(A'|B') = 0.15/0.30 \tag{6}$$

$$\Pr(A'|B') = 0.50 \tag{7}$$

similiarly, to obtain $\Pr(BA')$ we use

$$\Pr(BA') = \Pr(A') - \Pr(A'B') \tag{8}$$

$$= 0.20 - 0.15 \tag{9}$$

$$\Pr(BA') = 0.05 \tag{10}$$
