12.13.6.15 : Question. An electronic assembley consists of two subsystems,say A and B.From previous testing procedures, the following probabilities are assumed to be known:

$$\Pr(\text{A fails}) = 0.20 \tag{1}$$
$$\Pr(\text{B alone fails}) = 0.15 \tag{2}$$
$$\Pr(\text{A and B fails}) = 0.15 \tag{3}$$

Evaluate the following probabilities
1) $\Pr(\text{A fails given B has failed})$
2) $\Pr(\text{A fails alone})$

ans:

1)

$$\Pr(\text{A fails given B has failed}) = 0.50 \tag{4}$$

2)

$$\Pr(\text{A fails alone}) = 0.05 \tag{5}$$

Solution: Given ,

1)

$$\Pr(A') = 0.20 \tag{6}$$

2)

$$\Pr(AB') = 0.15 \tag{7}$$

3)

$$\Pr(A'B') = 0.15 \tag{8}$$

Now to find,$\Pr(A'|B')$ we use

$$\Pr(A'|B') = \frac{\Pr(A'B')}{\Pr(B')} \tag{9}$$

to obtain $\Pr(B')$

$$B'(1) = B'(A + A') \tag{10}$$
$$= B'A + B'A' \text{ since}((B'A)(B'A')) = 0 \tag{11}$$
$$\Pr(B') = \Pr(AB') + \Pr(A'B') \tag{12}$$

we use,

$$\Pr(B') = \Pr(AB') + \Pr(A'B') \,(\text{from } (12)) \tag{13}$$
$$= 0.15 + 0.15 \text{ (from } (7),(8)) \tag{14}$$
$$\implies \Pr(B') = 0.30 \tag{15}$$

now to find $\Pr(A'|B')$

$$\Pr(A'|B') = 0.15/0.30 \text{ (from } (15),(8),(9)) \tag{16}$$
$$\implies \Pr(A'|B') = 0.50 \tag{17}$$

similiarly, to obtain $\Pr(BA')$

$$BA' + B'A' = BA' + B'A' \tag{18}$$
$$BA' + B'A' = A'(B' + B) \tag{19}$$
$$BA' + B'A' = A' \tag{20}$$
$$A' = BA' + B'A' \text{ since}((A'B)(B'A')) = 0 \tag{21}$$
$$\Pr(A') = \Pr(BA') + \Pr(A'B') \tag{22}$$
$$\Pr(BA') = \Pr(A') - \Pr(A'B') \tag{23}$$

we use

$$\Pr(BA') = \Pr(A') - \Pr(A'B') \text{ from } (23) \tag{24}$$
$$= 0.20 - 0.15 \text{ from eq:}(6),(8) \tag{25}$$
$$\implies \Pr(BA') = 0.05 \tag{26}$$
